We created a Docker configuration for local deployment, including the definition of a secret.

We updated the Kamal configuration to use our builder, docker repository, DNS name, IP address, object storage secrets, and to configure logging; we placed our secrets in a password manager and updated `.kamal/secrets` to reference them. We configured Active Storage.

Testing

We maintained and enhanced tests throughout.

We employed unit tests to validation methods. We also tested increasing the quantity on a given line item.

Rails provided basic tests for all our scaffolded controllers, which we maintained as we made changes. We added tests along the way for things such as Ajax and ensuring that a cart has items before we create an order.

We used fixtures to provide test data to fuel our tests.

We created an integration test to test an end-to-end scenario involving a user adding product to a cart, entering an order, and receiving a confirmation email.

Deployment

We assembled our ingredients:

- Obtained an SSH key
- Acquired a machine
- Purchased a Domain Name
- Selected a Container Registry
- Used a Password Manager
- Set up a Builder
