for usage information on a particular generator; here's an example:

```
bin/rails generate migration
```

*new*
: Generates Rails application code.

*runner*
: Executes a method in your application outside the context of the Web. This is the noninteractive equivalent of `rails console`. You could use this to invoke cache expiry methods from a `cron` job or handle incoming email.

*server*
: Runs your Rails application in a self-contained web server, using the web server listed in your `Gemfile`, or WEBrick if none is listed. We've been using Puma in our Depot application during development.

## A Place for Temporary Files

It probably isn't a surprise that Rails keeps its temporary files tucked in the `tmp` directory. You'll find subdirectories for cache contents, sessions, and sockets in here. Generally these files are cleaned up automatically by Rails, but occasionally if things go wrong, you might need to look in here and delete old files.

## A Place for Third-Party Code

The `vendor` directory is where third-party code lives. You can install Rails and all of its dependencies into the `vendor` directory.

If you want to go back to using the system-wide version of gems, you can delete the `vendor/cache` directory.

## A Place for Configuration
