```
# ... order is now frozen
```

There are two class-level destruction methods: `destroy` (which takes an ID or an array of IDs) and `destroy_all` (which takes a condition). Both methods read the corresponding rows in the database table into model objects and call the instance-level `destroy` method of those objects. Neither method returns anything meaningful.

```
Order.destroy_all(["shipped_at < ?", 30.days.ago])
```

Why do we need both the `delete` and `destroy` class methods? The `delete` methods bypass the various Active Record callback and validation functions, while the `destroy` methods ensure that they're all invoked. In general, it's better to use the `destroy` methods if you want to ensure that your database is consistent according to the business rules defined in your model classes.

We covered validation in Chapter 7, *Task B: Validation and Unit Testing*. We cover callbacks next.
