for later processing by the controller.

Now let's look at the seven controller actions that these routes reference. Although we created our routes to manage the products in our application, let's broaden this to talk about resources—after all, the same seven methods will be required for all resource-based routes:

index
: Returns a list of the resources.

create
: Creates a new resource from the data in the `POST` request, adding it to the collection.

new
: Constructs a new resource and passes it to the client. This resource won't have been saved on the server. You can think of the `new` action as creating an empty form for the client to fill in.

show
: Returns the contents of the resource identified by `params[:id]`.

update
: Updates the contents of the resource identified by `params[:id]` with the data associated with the request.

edit
: Returns the contents of the resource identified by `params[:id]` in a form suitable for editing.

destroy
: Destroys the resource identified by `params[:id]`.

You can see that these seven actions contain the four basic CRUD operations (create, read, update, and delete). They also contain an action to list
