```
                <li>
                  <%= link_to 'Edit',
                              edit_product_path(product),
                              class: 'hover:underline' %>
                </li>

                <li>
                  <%= button_to 'Destroy',
                              product,
                              method: :delete,
                              class: 'hover:underline',
                              data: { turbo_confirm: "Are you sure?" } %>
                </li>
              </ul>
            </td>
          </tr>
        <% end %>
      </tbody>
    </table>
  </div>
```

The links to the actions that edit a product and add a new product should both use regular `GET` methods, so a standard `link_to` works fine. However, the request to destroy a product must issue an HTTP `DELETE`, so the call includes the `method: :delete` option to `button_to`.

Adding Additional Actions

Rails resources provide you with an initial set of actions, but you don't need to stop there. For example, if you want to add an interface to allow people to fetch a list of people who bought any given product, you can add an extension to the `resources` call:

```
Depot::Application.routes.draw do
  resources :products do
    get :who_bought, on: :member
  end
end
```
