```
  end
end
```

And so will this (because the controller will call a template directly if no action method is defined):

```
class BlogController < ApplicationController
end
```

render(text: string)

Sends the given string to the client. No template interpretation or HTML escaping is performed.

```
class HappyController < ApplicationController
  def index
    render(text: "Hello there!")
  end
end
```

render(inline: string, [type: "erb"|"builder"|"scss"], [locals: hash])

Interprets *string* as the source to a template of the given type, rendering the results back to the client. You can use the **:locals** hash to set the values of local variables in the template.

The following code adds **method_missing** to a controller if the application is running in development mode. If the controller is called with an invalid action, this renders an inline template to display the action's name and a formatted version of the request parameters:

```
class SomeController < ApplicationController

  if RAILS_ENV == "development"
    def method_missing(name, *args)
      render(inline: %{
        <h2>Unknown action: #{name}</h2>
        Here are the request parameters:<br/>
        <%= debug(params) %> })
    end
  end
end
```
