```
                    with: /\Aimage/,
                    message: "must be a picture"

  def uploaded_picture=(picture_field)
    self.name         = base_part_of(picture_field.original_filename)
    self.content_type = picture_field.content_type.chomp
    self.data         = picture_field.read
  end

  def base_part_of(file_name)
    File.basename(file_name).gsub(/[^\w._-]/, '')
  end
end
```

We define an accessor called `uploaded_picture=` to receive the file uploaded by the form. The object returned by the form is an interesting hybrid. It's file-like, so we can read its contents with the `read` method; that's how we get the image data into the `data` column. It also has the attributes `content_type` and `original_filename`, which let us get at the uploaded file's metadata. Accessor methods pick all this apart, resulting in a single object stored as separate attributes in the database.

Note that we also add a validation to check that the content type is of the form `image/`*xxx*. We don't want someone uploading JavaScript.

The `save` action in the controller is totally conventional:

rails80/e1/views/app/controllers/upload_controller.rb

```
def save
  @picture = Picture.new(picture_params)
  if @picture.save
    redirect_to(action: 'show', id: @picture.id)
  else
    render(action: :get)
  end
end
```
