Now that we have an image in the database, how do we display it? One way is to give it its own URL and link to that URL from an image tag. For example, we could use a URL such as `upload/picture/123` to return the image for picture 123. This would use `send_data` to return the image to the browser. Note how we set the content type and filename—this lets browsers interpret the data and supplies a default name should the user choose to save the image:

rails80/e1/views/app/controllers/upload_controller.rb

```
def picture
  @picture = Picture.find(params[:id])
  send_data(@picture.data,
            filename: @picture.name,
            type: @picture.content_type,
            disposition: "inline")
end
```

Finally, we can implement the `show` action, which displays the comment and the image. The action simply loads the picture model object:

rails80/e1/views/app/controllers/upload_controller.rb

```
def show
  @picture = Picture.find(params[:id])
end
```

In the template, the image tag links back to the action that returns the picture content. In the following screenshot, we can see the `get` and `show` actions.
