Inside the partial, the local variable `article` will be set to the current article from the collection—the variable is named after the template. In addition, the variable `article_counter` will have its value set to the index of the current article in the collection.

The optional `:spacer_template` parameter lets you specify a template that will be rendered between each of the elements in the collection. For example, a view might contain the following:

rails80/e1/views/app/views/partial/_list.html.erb

```
<%= render(partial:          "animal",
           collection:       %w{ ant bee cat dog elk },
           spacer_template: "spacer")
%>
```

This uses `_animal.html.erb` to render each animal in the given list, rendering the partial `_spacer.html.erb` between each. Say `_animal.html.erb` contains this:

rails80/e1/views/app/views/partial/_animal.html.erb

```
<p>The animal is <%= animal %></p>
```

And `_spacer.html.erb` contains this:

rails80/e1/views/app/views/partial/_spacer.html.erb

```
<hr />
```

Your users would see a list of animal names with a line between each.

Shared Templates

If the first option or `:partial` parameter to a render call is a String with no slashes, Rails assumes that the target template is in the current controller's view directory. However, if the name contains one or more / characters, Rails assumes that the part up to the last slash is a directory name and the
