rest is the template name. The directory is assumed to be under `app/views`. This makes it easy to share partials and subtemplates across controllers.

The convention among Rails applications is to store these shared partials in a subdirectory of `app/views` called `shared`. Render shared partials using statements such as these:

```
<%= render("shared/header", locals: {title: @article.title}) %>
<%= render(partial: "shared/post", object: @article) %>
. . .
```

In this previous example, the `@article` object will be assigned to the local variable `post` within the template.

Partials with Layouts

Partials can be rendered with a layout, and you can apply a layout to a block within any template:

```
<%= render partial: "user", layout: "administrator" %>

<%= render layout: "administrator" do %>
  # ...
<% end %>
```

Partial layouts are to be found directly in the `app/views` directory associated with the controller along with the customary underbar prefix, such as `app/views/users/_administrator.html.erb`.

Partials and Controllers

It isn't just view templates that use partials. Controllers also get in on the act. Partials give controllers the ability to generate fragments from a page using the same partial template as the view. This is particularly important when you're using Ajax support to update just part of a page from the controller—use partials, and you know your formatting for the table row or line item that you're updating will be compatible with that used to generate its brethren initially.
