```
    create_table :order_histories do |t|
     t.integer :order_id, null: false
     t.text :notes

     t.timestamps
    end

    order = Order.find :first
    OrderHistory.create(order_id: order, notes: "test")
  end
```

Later, in migration 7, we rename the table `order_histories` to `order_notes`. At this point we'll also have renamed the model `OrderHistory` to `OrderNote`.

Now we decide to drop our development database and reapply all migrations. When we do so, the migrations throw an exception in migration 4: our application no longer contains a class called `OrderHistory`, so the migration fails.

One solution, proposed by Tim Lucas, is to create local dummy versions of the model classes needed by a migration within the migration. For example, the following version of the fourth migration will work even if the application no longer has an `OrderHistory` class:

```
  class CreateOrderHistories < ActiveRecord::Migration

»   class Order < ApplicationRecord::Base; end
»   class OrderHistory < ApplicationRecord::Base; end

    def change
      create_table :order_histories do |t|
        t.integer :order_id, null: false
        t.text :notes

        t.timestamps
      end

     order = Order.find :first
     OrderHistory.create(order: order_id, notes: "test")
    end
```
