All this discussion suggests that migrations are dangerous to use on production databases. Should you run them? We really can't say. If you have database administrators in your organization, it'll be their call. If it's up to you, you'll have to weigh the risks. But if you decide to go for it, you really must back up your database first. Then you can apply the migrations by going to your application's directory on the machine with the database role on your production servers and executing this command:

```
depot> RAILS_ENV=production bin/rails db:migrate
```

This is one of those times where the legal notice at the start of this book kicks in. We're not liable if this deletes your data.
