Creating HTML Templates with Slim

Slim is a templating language that can replace ERB.[173] It's designed to require much less code to achieve the same results, and it does this by using a nested structure instead of HTML tags. Consider this ERB:

```
<h2><%= t('.title') %></h2>
<table>
  <%= render(cart.line_items) %>

  <tr class="total_line">
    <td colspan="2">Total</td>
    <td class="total_cell"><%= number_to_currency(cart.total_price) %></td>
  </tr>

</table>
```

In Slim, it would look like so:

```
h2
  = t('.title')
table
  = render(cart.line_items)

  tr.total_line
    td.colspan=2
      Total
    td.total_cell
      = number_to_currency(cart.total_price)
```

Slim treats each line as an opening HTML tag, and anything indented under that line will be rendered inside that tag. Helper methods and instance variables can be accessed using `=`, like so:

```
ul
  li = link_to @product.name, product_path(@product)
```

To execute logic, such as looping over a collection, use `-`, like so:
