rails80/demo2/app/views/say/hello.html.erb

```
    <h1>Hello from Rails!</h1>
»   <p>
»     It is now <%= Time.now %>
»   </p>
```

When we refresh our browser window, we see the time displayed using Ruby's standard format, as shown in the following screenshot.

Notice that the time displayed updates each time the browser window is refreshed. It looks as if we're really generating dynamic content.

Making Development Easier

You might have noticed something about the development we've been doing so far. As we've been adding code to our application, we haven't had to restart the running application. It's been happily chugging away in the background. And yet each change we make is available whenever we access the application through a browser. What gives?

It turns out that the Rails dispatcher is pretty clever. In development mode (as opposed to testing or production), it automatically reloads changed application source files when a new request comes along. That way, when we edit our application, the dispatcher makes sure it's running the most recent changes. Any delays will be small and generally unnoticeable since we're usually dealing with only one user at a time in development.

In testing and production, this feature is disabled because files won't be changing, and by not watching for file system changes, Rails can run a little faster. But in development, it's a real time-saver.

Adding the Time
