We already know that Rails uses a convention to parse the URL into a target controller and an action within that controller. So a simple approach would be to adopt this URL convention for our links.

The hello.html.erb file would contain the following:

```
...
<p>
  Say <a href="/say/goodbye">Goodbye</a>!
</p>
...
```

And the goodbye.html.erb file would point the other way:

```
...
<p>
  Say <a href="/say/hello">Hello</a>!
</p>
...
```

This approach would certainly work, but it's a bit fragile. If we were to move our application to a different place on the web server, the URLs would no longer be valid. It also encodes assumptions about the Rails URL format into our code; it's possible a future version of Rails could change that format.

Fortunately, these aren't risks we have to take. Rails comes with a bunch of *helper methods* that can be used in view templates. Here, we'll use the link_to helper method, which creates a hyperlink to an action. (The link_to method can do a lot more than this, but let's take it gently for now.) Using link_to, hello.html.erb becomes the following:

rails80/demo5/app/views/say/hello.html.erb

```
<h1>Hello from Rails!</h1>
<p>
  It is now <%= @time %>
</p>
```
