database, and we can unapply them to roll our database back. We have a whole section on migrations starting in Chapter 23, *Migrations*. For now, we'll just use them without too much more comment.

The migration has a UTC-based timestamp prefix (`20221207000001`), a name (`create_products`), and a file extension (`rb`, because it's Ruby code).

The timestamp prefix that you see will be different. In fact, the timestamps used in this book are clearly fictitious. Typically, your timestamps won't be consecutive; instead, they'll reflect the time the migration was created.

Applying the Migration

Although we've already told Rails about the basic data types of each property, let's refine the definition of the price to have eight digits of significance and two digits after the decimal point:

rails7/depot_a/db/migrate/20221207000001_create_products.rb

```
class CreateProducts < ActiveRecord::Migration[7.0]
  def change
    create_table :products do |t|
      t.string :title
      t.text :description
      t.string :image_url
»     t.decimal :price, precision: 8, scale: 2

      t.timestamps
    end
  end
end
```

Now that we're done with our changes, we need to get Rails to apply this migration to our development database. We do this by using the `bin/rails db:migrate` command:

```
depot> bin/rails db:migrate
==  20221207000001 CreateProducts: migrating ==================================
-- create_table(:products)
   -> 0.0027s
```
