

So we proudly show our customer her new product listing and she's pleased. Now it's time to create the storefront.

What We Just Did

In this chapter, we laid the groundwork for our store application:

- We created a development database.
- We used a migration to create and modify the schema in our development database.
- We created the `products` table and used the scaffold generator to write an application to maintain it.
- We updated a controller-specific view to show a list of products.

What we've done didn't require much effort, and it got us up and running quickly. Databases are vital to this application but need not be scary. In fact, in many cases we can defer the selection of the database and get started using the default that Rails provides.
