gone. Calling `bin/rails db:migrate` again will re-create it. You'll also want to reload the seed data. More information can be found in Chapter 23, *Migrations*.

- We mentioned version control in *Version Control*, and now would be a great point at which to save your work. Should you happen to choose Git (highly recommended, by the way), you need to do a tiny bit of configuration first; all you need to do is provide your name and email address:

```
depot> git config --global --add user.name "Sam Ruby"
depot> git config --global --add user.email rubys@intertwingly.net
```

You can verify the configuration with the following command:

```
depot> git config --global --list
```

Rails also provides a file named `.gitignore`, which tells Git which files are not to be version-controlled:

rails7/depot_a/.gitignore

```
# Ignore bundler config.
/.bundle

# Ignore the default SQLite database.
/db/*.sqlite3
/db/*.sqlite3-*

# Ignore all logfiles and tempfiles.
/log/*
/tmp/*
!/log/.keep
!/tmp/.keep

# Ignore pidfiles, but keep the directory.
/tmp/pids/*
!/tmp/pids/
!/tmp/pids/.keep

# Ignore uploaded files in development.
/storage/*
!/storage/.keep
```
