```
    assert product.invalid?
    assert_equal ["has already been taken"], product.errors[:title]
  end
```

The test assumes that the database already includes a row for the Ruby book. It gets the title of that existing row using this:

```
products(:ruby).title
```

It then creates a new `Product` model, setting its title to that existing title. It asserts that attempting to save this model fails and that the `title` attribute has the correct error associated with it.

If you want to avoid using a hardcoded string for the Active Record error, you can compare the response against its built-in error message table:

rails7/depot_c/test/models/product_test.rb

```
  test "product is not valid without a unique title - i18n" do
    product = Product.new(title:       products(:ruby).title,
                          description: "yyy",
                          price:       1,
                          image_url:   "fred.gif")

    assert product.invalid?
    assert_equal [I18n.translate('errors.messages.taken')],
                 product.errors[:title]
  end
```

We'll cover the I18n functions in Chapter 15, *Task J: Internationalization*.

Before we move on, we once again try our tests:

```
$ bin/rails test
```

This time we see two remaining failures, both in `test/controllers/products_controllertest.rb`: one in `should create product` and the other in `should update product`. Clearly, something we did caused something to do with the creation and update of products to fail. Since we just added validations on how products are created or updated, it's likely this is the source of the problem, and
