```
    assert_redirected_to product_url(Product.last)
  end
```

rails7/depot_b/test/controllers/products_controller_test.rb

```
  test "should update product" do

    patch product_url(@product), params: {
        product: {
          description: @product.description,
          image_url: @product.image_url,
          price: @product.price,
»         title: @title,
        }
      }

    assert_redirected_to product_url(@product)
  end
```

After making these changes, we rerun the tests, and they report that all is well.

Now we can feel confident that our validation code not only works but will continue to work. Our product now has a model, a set of views, a controller, and a set of unit tests. It'll serve as a good foundation on which to build the rest of the application.

What We Just Did

In about a dozen lines of code, we augmented the generated code with validation:

- We ensured that required fields are present.
- We ensured that price fields are numeric and at least one cent.
- We ensured that titles are unique.
- We ensured that images match a given format.
- We updated the unit tests that Rails provided, both to conform to the constraints we've imposed on the model and to verify the new code we added.

We show this to our customer, and although she agrees that this is something an administrator could use, she says that it certainly isn't anything that she would
