feel comfortable turning loose on her customers. Clearly, in the next iteration we're going to have to focus a bit on the user interface.

Playtime

Here's some stuff to try on your own:

- If you're using Git, now is a good time to commit your work. You can first see which files we changed by using the `git status` command:

```
depot> git status
# On branch master
# Changes not staged for commit:
#   (use "git add <file>..." to update what will be committed)
#   (use "git checkout -- <file>..." to discard changes
#    in working directory)
#
# modified:   app/models/product.rb
# modified:   test/fixtures/products.yml
# modified:   test/controllers/products_controller_test.rb
# modified:   test/models/product_test.rb
# no changes added to commit (use "git add" and/or "git commit -a")
```

  Since we modified only some existing files and didn't add any new ones, you can combine the `git add` and `git commit` commands and simply issue a single `git commit` command with the `-a` option:

```
depot> git commit -a -m 'Validation!'
```

  With this done, you can play with abandon, secure in the knowledge that you can return to this state at any time by using a single `git checkout .` command.

- The `:length` validation option checks the length of a model attribute. Add validation to the `Product` model to check that the title is at least ten characters.

- Change the error message associated with one of your validations.
