What We Just Did

We put together the basis of the store's catalog display. The steps were as follows:

1. Create a new controller to handle customer-centric interactions.
2. Implement the default `index` action.
3. Add a call to the `order` method within the `Store` controller to control the order in which the items on the website are listed.
4. Implement a view (a `html.erb` file) and a layout to contain it (another `html.erb` file).
5. Use a helper to format prices the way we want.
6. Make use of a CSS style sheet.
7. Write functional tests for our controller.
8. Implement fragment caching for portions of the page.

It's time to check it all in and move on to the next task—namely, making a shopping cart!

Playtime

Here's some stuff to try on your own:

- Add a date and time to the sidebar. It doesn't have to update; just show the value at the time the page was displayed.
- Experiment with setting various `number_to_currency` helper method options, and see the effect on your catalog listing.
- Write some functional tests for the product management application using
