```
    end
  end
```

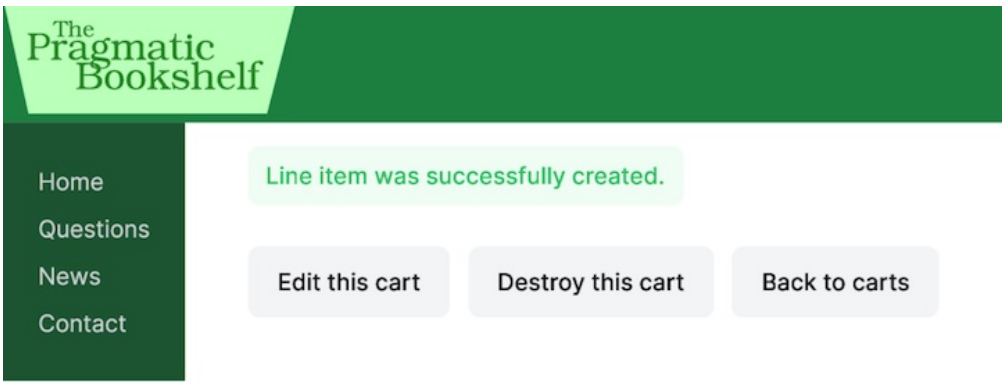

We use the `params` object to get the `:product_id` parameter from the request. The `params` object is important inside Rails applications. It holds all of the parameters passed in a browser request. We store the result in a local variable because there's no need to make this available to the view.

We then pass that product we found into `@cart.line_items.build`. This causes a new line item relationship to be built between the `@cart` object and the `product`. You can build the relationship from either end, and Rails takes care of establishing the connections on both sides.

We save the resulting line item into an instance variable named `@line_item`.

The remainder of this method takes care of handling errors, which we'll cover in more detail in *Iteration E2: Handling Errors*, (as well as handling JSON requests, which we don't need per se but that were added by the Rails generator). But for now, we want to modify only one more thing: once the line item is created, we want to redirect users to the cart instead of back to the line item. Since the line item object knows how to find the cart object, all we need to do is add `.cart` to the method call.

Confident that the code works as intended, we try the Add to Cart buttons in our browser. And the following screenshot shows what we see.

This is a bit underwhelming. We have scaffolding for the cart, but when we created it we didn't provide any attributes, so the view doesn't have anything to
