```
          cart.line_items.where(product_id: product_id).delete_all

          # replace with a single item
          item = cart.line_items.build(product_id: product_id)
          item.quantity = quantity
          item.save!
        end
      end
    end
  end
```

This is easily the most extensive code you've seen so far. Let's look at it in small pieces:

- We start by iterating over each cart.
- For each cart, we get a sum of the quantity fields for each of the line items associated with this cart, grouped by `product_id`. The resulting sums will be a list of ordered pairs of `product_id`s and quantity.
- We iterate over these sums, extracting the `product_id` and `quantity` from each.
- In cases where the quantity is greater than one, we delete all of the individual line items associated with this cart and this product and replace them with a single line item with the correct quantity.

Note how easily and elegantly Rails enables you to express this algorithm.

With this code in place, we apply this migration like any other migration:

```
depot> bin/rails db:migrate
```

We can see the results by looking at the cart, shown in the following screenshot.
