Iteration F3: Highlighting Changes

A common way to highlight changes made to a page is the (now) infamous Yellow Fade Technique.[54] It highlights an element in a browser: by default it flashes the background yellow and then gradually fades it back to white. The user clicks the Add to Cart button, and the count updates to two as the line flares brighter. It then fades back to the background color over a short period of time.

While Tailwind provides an extensive set of utility CSS classes to cover most needs, there comes a time when you need something more. For us, now is that time.

You can implement this with CSS animations.[55] In CSS animations, a class uses the `animation` attribute to reference a particular animation. The animation itself is defined as a series of keyframes that describe the style of an element at various points in the animation. The animation is executed by the browser when the page loads or when the class is applied to an element. This sounds complicated, but for our case we only need to define the starting and ending states of the element.

Let's see the CSS first. We'll place it inside `app/assets/stylesheets/line_items.css`. You can name the file whatever you like as long as it ends in `css` and is placed in this directory, and it will be made available to your entire application. Generally it makes sense to group related things into separate files.

rails7/depot_n/app/assets/stylesheets/line_items.css

```
@keyframes line-item-highlight {
  0% {
    background: #8f8;
  }

  100% {
    background: none;
  }
}

.line-item-highlight {
```
