In the `_line_item.html.erb` partial, we then check to see if the item we're rendering is the one that just changed. If so, we give it the animation class we just defined:

rails7/depot_o/app/views/line_items/_line_item.html.erb

```
» <% if line_item == @current_item %>
» <tr class="line-item-highlight">
» <% else %>
» <tr>
» <% end %>
    <td class="text-right"><%= line_item.quantity %></td>
    <td>&times;</td>
    <td class="pr-2">
      <%= line_item.product.title %>
    </td>
    <td class="text-right font-bold">
      <%= number_to_currency(line_item.total_price) %>
    </td>
  </tr>
```

As a result of these two minor changes, the `<tr>` element of the most recently changed item in the cart will be tagged with `class="line-item-highlight"`. When the browser receives this rendered HTML and inserts it into the DOM, the browser will see that the most recently added line item has the class `line-item-highlight`, which will trigger the animation. No JavaScript needed!

With that change in place, reload the page, then click any Add to Cart button, and you'll see that the changed item in the cart glows a light green before fading back to merge with the background.

We're not done yet. We haven't tested any of our Hotwired additions, such as what happens when we click the Add to Cart button. Rails provides the help we need to do that too.

We already have a `should create line_item` test, so let's add another one called `should create line_item via turbo-stream`:

rails7/depot_o/test/controllers/line_items_controller_test.rb

```
  test "should create line_item via turbo-stream" do
```
