```
        </div>
      </div>
    </li>
» <% end %>
```

We use the handy `turbo_frame_tag` helper to create the HTML element, as well as the `dom_id` helper to create a unique `id` for every product.

Next, we make two changes to the template from which this was extracted. First, we add a call to `turbo_stream_from` to identify what channel we'll subscribe to. Next we make use of the partial that we just created.

rails7/depot_o/app/views/store/index.html.erb

```
  <div class="w-full">
  <%= render 'notice' %>

  <h1 class="font-bold text-xl mb-6 pb-2 border-b-2">
    Your Pragmatic Catalog
  </h1>

» <%= turbo_stream_from 'products' %>
»
  <ul>
    <% cache @products do %>
      <% @products.each do |product| %>
        <% cache product do %>
»         <%= render partial: 'product', object: product %>
        <% end %>
      <% end %>
    <% end %>
  </ul>
  </div>
```

All that remains to be done is to broadcast the HTML for a product every time an update is made:

rails7/depot_o/app/controllers/products_controller.rb

```
    def update
      respond_to do |format|
        if @product.update(product_params)
          format.html { redirect_to product_url(@product),
```
