Because the text field is constructed in the context of `form_with`, it's automatically associated with the data in the `order` object. This association means that submitting the form will set the right names and values in the data available to the controller, but it will also pre-populate the form fields with any values already existing on the model.

All these relationships can be confusing. It's important to remember that Rails needs to know both the *names* and the *values* to use for the fields associated with a model. The combination of `form_with` and the various field-level helpers (such as `text_field`) gives it this information.

Now we can update the template for the form that captures a customer's details for checkout. It's invoked from the `new` action in the order controller, so the template is called `new.html.erb`, found in the `app/views/orders` directory:

rails7/depot_o/app/views/orders/new.html.erb

```
  <div class="mx-auto md:w-2/3 w-full">
»   <h1 class="font-bold text-4xl">Please Enter Your Details</h1>

    <%= render "form", order: @order %>
  </div>
```

In this file, we've updated the `h1` and removed the link back to the orders index. This template makes use of a partial named `_form`. We take a peek at that file and see many long lines repeating the same class definitions. Let's introduce another CSS rule so that we can clean this up:

rails7/depot_o/app/assets/stylesheets/application.tailwind.css

```
  @tailwind base;
  @tailwind components;
  @tailwind utilities;

» @layer components {
»   .input-field { @apply
»     block shadow rounded-md border border-green-400 outline-none
»     px-3 py-2 mt-2 w-full
»   }
```
