

Looking good! Before we move on, let's finish the `new` action by adding some validation. We'll change the `Order` model to verify that the customer enters data for all the input fields. We'll also validate that the payment type is one of the accepted values:

rails7/depot_o/app/models/order.rb

```
  class Order < ApplicationRecord
    # ...
»   validates :name, :address, :email, presence: true
»   validates :pay_type, inclusion: pay_types.keys
  end
```

Some folks might be wondering why we bother to validate the payment type, given that its value comes from a drop-down list that contains only valid values. We do it because an application can't assume that it's being fed values from the forms it creates. Nothing is stopping a malicious user from submitting form data directly to the application, bypassing our form. If the user sets an unknown payment type, that user might conceivably get our products for free.

Note that we already loop over the `@order.errors` at the top of the page. This'll report validation failures.

Since we modified validation rules, we need to modify our test fixture to match:
