## Capturing the Order Details

Let's implement the `create` action in the controller. This method has to do the following:

1. Capture the values from the form to populate a new `Order` model object.
2. Add the line items from our cart to that order.
3. Validate and save the order. If this fails, display the appropriate messages, and let the user correct any problems.
4. Once the order is successfully saved, delete the cart, redisplay the catalog page, and display a message confirming that the order has been placed.

We define the relationships themselves, first from the line item to the order:

rails7/depot_o/app/models/line_item.rb

```
  class LineItem < ApplicationRecord
»   belongs_to :order, optional: true
    belongs_to :product
»   belongs_to :cart, optional: true

    def total_price
      price * quantity
    end
  end
```

And then we define the relationship from the order to the line item, once again indicating that all line items that belong to an order are to be destroyed whenever the order is destroyed:

rails7/depot_o/app/models/order.rb

```
  class Order < ApplicationRecord
»   has_many :line_items, dependent: :destroy
    # ...
  end
```

The method ends up looking something like this:
