```
      <%= form.label :account_number %>
      <%= form.password_field :account_number, class: "input-field" %>
    </div>
  </fieldset>
```

The first line defines a payment target of `additionalFields` as well as a type of `Check`. This matches up with the controller, which defined `additionalFields` as a target and matches the `fields.dataset.type` against the value from the `selection` target.

The remainder of this file is familiar: it defines the two new fields exactly as we have been defining them all along. The only new thing is the reference to a `password_field`, which causes most browsers to hide the text as you are entering it.

Next up, we need to define fields for a credit card number and an expiration date. We put them into a second partial:

rails7/depot_p/app/views/orders/_cc.html.erb

```
  <fieldset data-payment-target="additionalFields" data-type="Credit card">
    <div class="my-5">
      <%= form.label :credit_card_number %>
      <%= form.password_field :credit_card_number, class: "input-field" %>
    </div>

    <div class="my-5">
      <%= form.label :expiration_date %>
      <%= form.text_field :expiration_date, class: "input-field",
        size:9, placeholder: "e.g. 03/22" %>
    </div>
  </fieldset>
```

No surprises here. Finally, we need a purchase order number field, which we put into a third partial:

rails7/depot_p/app/views/orders/_po.html.erb

```
  <fieldset data-payment-target="additionalFields" data-type="Purchase order">
    <div class="my-5">
      <%= form.label :po_number %>
      <%= form.number_field :po_number, class: "input-field" %>
```
