```
»                       'data-action' => 'payment#showAdditionalFields',
                       class: "input-field" %>
      </div>
»
»     <%= render partial: 'check', locals: {form: form} %>
»     <%= render partial: 'cc', locals: {form: form} %>
»     <%= render partial: 'po', locals: {form: form} %>
»   </div>

    <div class="inline">
      <%= form.submit 'Place Order',  class: "rounded-lg py-3 px-5
        bg-green-200 text-black inline-block font-medium cursor-pointer" %>
    </div>
  <% end %>
```

This file has three sets of changes.

- First, we wrap all of the elements that are to be controlled by the payment Stimulus controller with a `div` element containing a `data-controller` field naming the controller.
- Next, we identify the `form.select` element as the `selection` target for the payment controller and associate an action by naming the method to be called when the selection changes.
- Finally, we render the three partials that we just created.

With both the code and markup now in place, we revisit the browser to see the results shown in the screenshots.
