performed. Once the test is complete, both are stopped and the results of the test are reported back to you. All this is based on your instructions as to what actions and tests are to be performed, and it's then expressed clearly and succinctly as a system test.

Note that system tests tend to take a bit longer to execute than model or controller tests, which is why they're not run as a part of `bin/rails test`. But all in all, these tests aren't all that slow, and they can test things that can't be tested in any other way, so system tests are a valuable tool to have in our toolchest.

## What We Just Did

- We replaced a static `form_select` field with a dynamic list of form fields that change instantly based on user selection.
- We wrote a Stimulus controller that attached to the HTML to make the dynamic changes happen.
- We used Capybara to system-test this functionality.

## Playtime

Here's some stuff to try on your own:

- Add an order and check the logs, and you'll see a number of *Unpermitted parameters* messages. While new fields were added to the form, they have yet to be added to the database. Generate a migration to add the fields, and add them to the `order_parameters` method.
- Add a test to verify that the Add to Cart and Empty Cart buttons reveal and hide the cart, respectively.
- Add a test of the highlight feature you added in *Iteration F3: Highlighting Changes*. The Capybara `have_css` method[62] may be useful here.
