## Iteration I1: Adding Users

Let's start by creating a model and database table to hold our administrators' usernames and passwords. Rather than store passwords in plain text, we'll store a digest hash value of the password. By doing so, we ensure that even if our database is compromised, the hash won't reveal the original password, so it can't be used to log in as this user using the forms:

```
depot> bin/rails generate scaffold User name:string password:digest
```

We declare the password as a `digest` type, which is another one of the nice extra touches that Rails provides. Now run the migration as usual:

```
depot> bin/rails db:migrate
```

Next, we have to flesh out the user model:

rails7/depot_r/app/models/user.rb

```
class User < ApplicationRecord
  has_secure_password
end
```

We check that the name is present and unique (that is, no two users can have the same name in the database).

Then there's the mysterious `has_secure_password`.

You know those forms that prompt you to enter a password and then make you reenter it in a separate field so they can validate that you typed what you thought you typed? That's exactly what `has_secure_password` does for you: it tells Rails to validate that the two passwords match. This line was added for you because you specified `password:digest` when you generated your scaffold.

The next step is to uncomment the `bcrypt-ruby` gem in your `Gemfile`:

rails7/depot_r/Gemfile
