```
    # Use Active Model has_secure_password
    # [https://guides.rubyonrails.org/active_model_basics.html#securepassword]
» gem "bcrypt", "~> 3.1.7"
```

Next, you need to install the gem:

```
depot> bundle install
```

Finally, you need to restart your server.

With this code in place, we have the ability to present both a password and a password confirmation field in a form, as well as the ability to authenticate a user, given a name and a password.

Administering Our Users

In addition to the model and table we set up, we already have some scaffolding generated to administer the model. Let's go through it and make some tweaks as necessary.

We start with the controller. It defines the standard methods: `index`, `show`, `new`, `edit`, `create`, `update`, and `delete`. By default, Rails omits the unintelligible password hash from the view. This means that in the case of users, there isn't much to `show` except a name. So let's avoid the redirect to showing the user after a create operation. Instead, let's redirect to the user's index and add the username to the flash notice:

rails7/depot_r/app/controllers/users_controller.rb

```
    def create
      @user = User.new(user_params)

      respond_to do |format|
        if @user.save
»         format.html { redirect_to users_url,
»           notice: "User #{@user.name} was successfully created." }
          format.json { render :show, status: :created, location: @user }
        else
          format.html { render :new, status: :unprocessable_entity }
          format.json { render json: @user.errors,
            status: :unprocessable_entity }
```
