```
»   before_action :set_i18n_locale_from_params
    # ...
    protected
»     def set_i18n_locale_from_params
»       if params[:locale]
»         if I18n.available_locales.map(&:to_s).include?(params[:locale])
»           I18n.locale = params[:locale]
»         else
»           flash.now[:notice] =
»             "#{params[:locale]} translation not available"
»           logger.error flash.now[:notice]
»         end
»       end
»     end
  end
```

This `set_i18n_locale_from_params` does pretty much what it says: it sets the locale from the params, but only if there's a locale in the params; otherwise, it leaves the current locale alone. Care is taken to provide a message for both the user and the administrator when a failure occurs.

With this in place, we can see the results in the following screenshot of navigating to `http://localhost:3000/en`.
