```
»           </div>
»         <% end %>
»       <% else %>
»         <h4>Our response:</h4>
»         <p>
»           <blockquote>
»             <%= support_request.response %>
»           </blockquote>
»         </p>
»       <% end %>

        <hr>
      </li>
    <% end %>
  </ul>
```

Note that we check to see if the support request has a response, and if it does, we render it. As we'll see, this has been enhanced by Action Text.

The last step is to implement `update` in our controller:

rails7/depot_tc/app/controllers/support_requests_controller.rb

```
  class SupportRequestsController < ApplicationController
    def index
      @support_requests = SupportRequest.all
    end

»   def update
»     support_request = SupportRequest.find(params[:id])
»     support_request.update(response: params.require(:support_request)[:response])
»     SupportRequestMailer.respond(support_request).deliver_now
»     redirect_to support_requests_path
»   end
  end
```

Now, start up your server and, assuming you've created some support requests, you should now see a rich-text editor instead of a plain old text area, like so:
