create
: Creates a new resource from the data in the `POST` request, adding it to the collection.

new
: Constructs a new resource and passes it to the client. This resource will not have been saved on the server. You can think of the `new` action as creating an empty form for the client to fill in.

show
: Returns the contents of the resource identified by `params[:id]`.

update
: Updates the contents of the resource identified by `params[:id]` with the data associated with the request.

edit
: Returns the contents of the resource identified by `params[:id]` in a form suitable for editing.

destroy
: Destroys the resource identified by `params[:id]`.

You can see that these seven actions contain the four basic CRUD operations (create, read, update, and delete). They also contain an action to list resources and two auxiliary actions that return new and existing resources in a form suitable for editing on the client.

If for some reason you don't need or want all seven actions, you can limit the actions produced using `:only` or `:except` options on your `resources`:

```
resources :comments, except: [:update, :destroy]
```

Several of the routes are named routes enabling you to use helper functions such as `products_url` and `edit_product_url(id:1)`.

Note that each route is defined with an optional format specifier. We'll cover formats in more detail in *Selecting a Data Representation*.
