that the path to a review must always be prefixed by the path to a particular product. To fetch the review with ID 4 for the product with an ID of 99, you'd use a path of `/products/99/reviews/4`.

The named route for `/products/:product_id/reviews/:id` is `product_review`, not simply `review`. This naming simply reflects the nesting of these resources.

As always, you can see the full set of routes generated by our configuration by using the `rails routes` command.

Routing Concerns

So far, we've been dealing with a fairly small set of resources. On a larger system there may be types of objects for which a `review` may be appropriate or to which a `who_bought` action might reasonably be applied. Instead of repeating these instructions for each resource, consider refactoring your routes using `concern`s to capture the common behavior.

```
concern :reviewable do
  resources :reviews
end

resources :products, concern: :reviewable
resources :users, concern: :reviewable
```

The preceding definition of the `products` resource is equivalent to the one in the previous section.

Shallow Route Nesting

At times, nested resources can produce cumbersome URLs. A solution to this is to use shallow route nesting:

```
resources :products, shallow: true do
  resources :reviews
end
```

This will enable the recognition of the following routes:
