Let’s look at the render options used in the controller here (we’ll look separately at rendering in the view starting in *Partial-Page Templates*):

render()

With no overriding parameter, the `render` method renders the default template for the current controller and action. The following code will render the template `app/views/blog/index.html.erb`:

```
class BlogController < ApplicationController
  def index
    render
  end
end
```

So will the following (as the default behavior of a controller is to call `render` if the action doesn’t):

```
class BlogController < ApplicationController
  def index
  end
end
```

And so will this (because the controller will call a template directly if no action method is defined):

```
class BlogController < ApplicationController
end
```

render(text: string)

Sends the given string to the client. No template interpretation or HTML escaping is performed.

```
class HappyController < ApplicationController
  def index
    render(text: "Hello there!")
  end
end
```

render(inline: string, [type: "erb"|"builder"|"scss"], [locals: hash])

Interprets *string* as the source to a template of the given type, rendering the results back to the client. You can use the `:locals` hash to set the values of
