Suggests to the browser that the file should be displayed inline (option `inline`) or downloaded and saved (option `attachment`, the default).

`:filename` *(string)*
: A suggestion to the browser of the default filename to use when saving the file. If not set, defaults to the filename part of *path*.

`:status` *string*
: The status code (defaults to `"200 OK"`).

`:stream` *(true or false)*
: If `false`, the entire file is read into server memory and sent to the client. Otherwise, the file is read and written to the client in `:buffer_size` chunks.

`:type` *(string)*
: The content type, defaulting to `application/octet-stream`.

You can set additional headers for either `send_` method by using the `headers` attribute in the controller:

```
def send_secret_file
  send_file("/files/secret_list")
  headers["Content-Description"] = "Top secret"
end
```

We show how to upload files starting in *Uploading Files to Rails Applications*.

Redirects

An HTTP redirect is sent from a server to a client in response to a request. In effect, it says, “I’m done processing this request, and you should go here to see the results.” The redirect response includes a URL that the client should try next along with some status information saying whether this redirection is permanent (status code 301) or temporary (307). Redirects are sometimes used when web pages are reorganized; clients accessing pages in the old locations will get referred to the page’s new home. More commonly, Rails applications use redirects to pass the processing of a request off to some other action.
