```
      invoke  assets
      invoke    scss
      create      app/assets/stylesheets/say.scss
```

The `rails generate` command logs the files and directories it examines, noting when it adds new Ruby scripts or directories to our application. For now, we're interested in one of these scripts and (in a minute) the `html.erb` files.

The first source file we'll be looking at is the controller. You can find it in the `app/controllers/say_controller.rb` file.

Let's take a look at it:

rails7/demo1/app/controllers/say_controller.rb

```
  class SayController < ApplicationController
»   def hello
»   end

    def goodbye
    end
  end
```

Pretty minimal, eh? `SayController` is a class that inherits from `ApplicationController`, so it automatically gets all the default controller behavior. What does this code have to do? For now, it does nothing—we simply have empty action methods named `hello` and `goodbye`. To understand why these methods are named this way, you need to look at the way Rails handles requests.

Rails and Request URLs

Like any other web application, a Rails application appears to its users to be associated with a URL. When you point your browser at that URL, you're talking to the application code, which generates a response to you.

Let's try it now. Navigate to the URL http://localhost:3000/say/hello in a browser. You'll see something that looks like the following screenshot.
