display the current time:

rails7/demo2/app/views/say/hello.html.erb

```
  <h1>Hello from Rails!</h1>
» <p>
»   It is now <%= Time.now %>
» </p>
```

When we refresh our browser window, we see the time displayed using Ruby's standard format, as shown in the following screenshot.

Notice that the time displayed updates each time the browser window is refreshed. It looks as if we're really generating dynamic content.

**Making Development Easier**

You might have noticed something about the development we've been doing so far. As we've been adding code to our application, we haven't had to restart the running application. It's been happily chugging away in the background. And yet each change we make is available whenever we access the application through a browser. What gives?

It turns out that the Rails dispatcher is pretty clever. In development mode (as opposed to testing or production), it automatically reloads application source files when a new request comes along. That way, when we edit our application, the dispatcher makes sure it's running the most recent changes. This is great for development.

However, this flexibility comes at a cost: it causes a short pause after you enter a URL before the application responds. That's caused by the dispatcher reloading stuff. For development it's a price worth paying, but in production it would be unacceptable. For this reason, this feature is disabled for production deployment.

## Adding the Time

Our original problem was to display the time to users of our application. We now
