know how to make our application display dynamic data. The second issue we have to address is working out where to get the time from.

We've shown that the approach of embedding a call to Ruby's `Time.now` method in our `hello.html.erb` template works. Each time they access this page, users will see the current time substituted into the body of the response. And for our trivial application, that might be good enough. In general, though, we probably want to do something slightly different. We'll move the determination of the time to be displayed into the controller and leave the view with the job of displaying it. We'll change our action method in the controller to set the time value into an instance variable called `@time`:

rails7/demo3/app/controllers/say_controller.rb

```
  class SayController < ApplicationController
    def hello
»     @time = Time.now
    end

    def goodbye
    end
  end
```

In the `html.erb` template, we'll use this instance variable to substitute the time into the output:

rails7/demo3/app/views/say/hello.html.erb

```
  <h1>Hello from Rails!</h1>
  <p>
»   It is now <%= @time %>
  </p>
```

When we refresh our browser window, we again see the current time, showing that the communication between the controller and the view was successful.

Why did we go to the extra trouble of setting the time to be displayed in the controller and then using it in the view? Good question. In this application, it doesn't make much difference, but by putting the logic in the controller instead,
