```
  </ul>
</div>
...33
```

Refresh your browser and go to Products->New, you should see:

Step 10. Add authentication and authorization gems

Let's move on to the most important thing in this article – authentication and authorization.

First, add these authentication and authorization gems to our Gemfile:

```
...12
gem 'devise'
gem 'cancancan', '~> 1.10'
gem 'rolify'
...16
```

Then bundle everything:

```
$ bundle install
```

Step 11. Add Devise to the project

We have added Devise to Gemfile, now let's generate Devise files:

```
$ rails generate devise:install
```

After running this command, some instructions will be displayed on your console.

We only have to do step 1 and 4.

In the first step, ensure you have defined default url options in your environments files. Go to config/environments/development.rb file and add this line:

```
...1
config.action_mailer.default_url_options = { host:
'localhost', port: 3000 }
...3
```

In the fourth step, we will add Devise views to our app by running:

```
$ rails g devise:views
```
