

# Step 17. Add a new field to the user

In this step, we will add a username field to the User. First, we have to generate a new migration:

```
$ rails g migration add_username_to_users username:string
$ rake db:migrate
```

Next, add username to the app/views/registrations/ edit.html.erb and app/views/registrations/new.html.erb files:

```
new.html.erb
...10
<div class="row">
  <div class="form-group col-md-4">
    <%= f.label :username %><br />
    <%= f.text_field :username, autofocus: true, class:
"form-control" %>
  </div>
</div>
...17

edit.html.erb
...9
<div class="row">
  <div class="form-group col-md-4">
    <%= f.label :username %><br />
    <%= f.text_field :username, autofocus: true, class:
"form-control" %>
  </div>
</div>
...16
```

After that, add to your app/controllers/ application_controller.rb file, the following lines:

```
...2
before_action :configure_permitted_parameters,
if: :devise_controller?

  protected
```
