```
  has_many :products, dependent: :destroy
end
```

Then using the Devise helper method current_user, which returns a current signed-in user, we can add current signed-in user to product. Let's modify the create action in your app/controllers/products_controller.rb file to look like:

```
def create
  @product = Product.new(product_params)
  @product.user = current_user
  if @product.save
    redirect_to @product, notice: 'Product was successfully
created.'
  else
    render :new
  end
end
```

Finally, modify app/views/products/index.html.erb file by adding the Creator column to the table:

```
...7
 <th class="col-md-2">Price</th>
 <th class="col-md-2">Creator</th>
 <th class="col-md-4">Options</th>
...11

...16
 <td class="col-md-2">$<%= product.price %></td>
 <td class="col-md-2"><%= product.user.try(:email) %></td>
 <td class="col-md-4">
...20
```

Now let's log into the application and create a new product. After that, go to the product list. In the column Creator, you will see a current user email alongside of the product which you have just now created. For example, when the user darek.milik@gmail.com creates a product which contains the name Keyboard and a price of 120 we get:
