```
class AdminsController < ApplicationController
  USERS = { "lifo" => "world" }

  before_action :authenticate

  private

    def authenticate
      authenticate_or_request_with_http_digest do |
username|
        USERS[username]
      end
    end
end
```

As seen in the example above, the `authenticate_or_request_with_http_digest` block takes only one argument - the username. And the block returns the password. Returning `false` or `nil` from the `authenticate_or_request_with_http_digest` will cause authentication failure.
