Step 19. Add Roles

In step 12, we added Rolify to Gemfile. In this step, I will show you how we can use this gem. Let's say that we want to create two types of users in our application: an admin, a person which will have access to every action in our application, and a client, a person with limited access. To do that, first we have to create Role model and migrate the database:

```
$ rails g rolify Role User
$ rake db:migrate
```

Finally, remove from app/models/Role.rb file, this line:

```
optional => true
```

Step 20. Populating the Database with seeds.rb

Let's clean our database by running:

```
$ rake db:reset db:migrate
```

Next, we add some products to the database and create two users, Nicole (admin) and Bruce (client).

Please modify the db/seeds.rb file to look like this:

seeds.rb

and after that, run:

```
$ rake db:seed
```

Reload the browser and go to the product list, where you should see something like this:
