

Step 21. Add CanCanCan to product

In step 12, we added CanCanCan to Gemfile. Let's now use this gem.

Create the Ability class from CanCanCan:

```
$ rails generate cancan:ability
$ rake db:migrate
```

The Ability class is a place were user permissions are defined. Let's add two helper methods to app/models/user.rb file:

```
...5
def admin?
  has_role?(:admin)
end

def client?
  has_role?(:client)
end
...13
```

We will use these methods to check which role users have.

Modify your app/models/ability.rb file to look like:

```
class Ability
  include CanCan::Ability
  def initialize(user)
    user ||= User.new
    if user.client?
      can :manage, Product, user_id: user.id
    elsif user.admin?
      can :manage
```
